

A close-up photograph of several wooden flutes, which are cylindrical tubes with a series of semi-circular grooves along their length. The flutes are arranged in a slightly overlapping, fanned-out manner, showing their natural wood grain and light brown color. The background is dark, making the wood stand out. Two thick, diagonal, light-colored lines cross the image from the top right towards the bottom left, partially overlapping the flutes and the text area.

About

Wood Flute Panels

Wood flute is a sleek new interior finishes that can be used as a decorative material with sound diffusing properties. Wood flute surface gather the advantages of having a natural wood grain surface treatment but can be coloured to achieve a certain design intent. It has a seamless linear design, elegant and it is very suitable for acoustic conditions that requires diffusion and absorption. Applicable for indoor wall cladding that reflects the simplicity of linear styles. Wood flute makes up for a beautiful interior facade that is sure to elevate any space.

Application : Wall and Ceiling Cladding, Built-in Furnitures

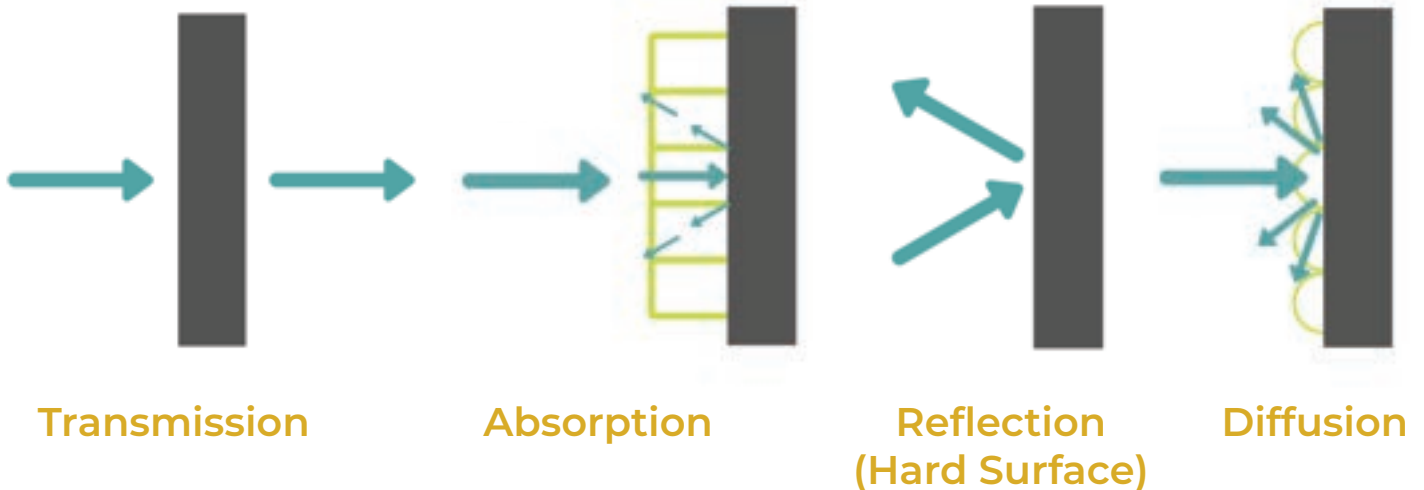

Technical Data

Wood Flute Sound Diffusion Information

SOUND INTERACTION WITH SURFACE

Acoustic diffusion is the process of breaking up high frequencies that would normally reflect around the room in a directional manner, instead of scattering more evenly throughout the space. Proper placement of diffusion panels help improve the stereo imaging in your mixing position, and will generally help balance out the sound all around the room. Within a space, adding diffusor panels will make up for a consistent, sonically-balanced space making it possible to have a more pleasing sense of room ambience.
